PROFESSIONAL SUMMARY

Data Scientist with a Ph.D. in Mathematics and expertise in network analysis, machine learning, and quantum computing. Recently analyzed 121K+ arXiv papers using advanced network science techniques to uncover collaboration patterns in research communities. Proven ability to translate mathematical theory into production-ready solutions. Seeking data-driven roles leveraging deep technical expertise in Python.

TECHNICAL SKILLS

- **Languages:** Python, SQL, LaTeX
 - **ML Libraries:** Scikit-learn, PyTorch, XGBoost, NumPy, SciPy, Pandas, Matplotlib, NetworkX
 - **Tools:** Jupyter, Git, ipywidgets, PostgreSQL
 - **Specializations:** Machine Learning, Statistical Modeling, Quantum Computing, Algebraic Topology, Category Theory, Graph Theory, Representation Theory
 - **Certifications:** [Deep Learning Specialization](#) (deeplearning.ai), [Machine Learning Specialization](#) (deeplearning.ai), [SQL for Data Science](#) (Coursera), [Applied Social Network Analysis](#) (Coursera)
-

PROFESSIONAL EXPERIENCE

Quantum Formalism — *Remote*

Mathematics Consultant

Nov. 2024 – Present

- Engineered hands-on computational exercises in Python notebooks demonstrating quantum and classical ML concepts using Scikit-learn, PyTorch, PennyLane, and SciPy.
- Designed and delivered advanced graduate-level curriculum bridging Lie Theory with practical Quantum Computing and Machine Learning applications (Course: [\[Lie Groups with Applications\]](#)).
- Developed visualization tools for dynamic simulation of quantum systems using Matplotlib and ipywidgets; applied concepts like Hamiltonian evolution, $SU(4)$ decomposition, and error quantification.

Institut de Mathématiques de Jussieu-Paris Rive Gauche — *Paris, France*

Postdoctoral Researcher

2023 – Sept. 2024

- Developed advanced mathematical models for complex systems exhibiting irregular behavior as part of Fondation Sciences Mathématiques de Paris-funded project under François Loeser.

University of Wisconsin–Madison — *Madison, WI*

Visiting Assistant Professor

2019 – 2023

- Developed and published a novel theoretical framework (Publ. RIMS Kyoto Univ.) extending advanced analytical techniques to model complex systems exhibiting irregular behavior.
 - Secured \$5,000 AMS-Simons research grant for reformulating 40-year-old mathematical problem integrating analytical and topological perspectives; designed and taught undergraduate/graduate mathematics curricula.
-

SELECTED PROJECTS

Math Research Compass: arXiv Trends Dashboard (GitHub [\[link\]](#), mathresearchcompass.com)

- Built full-stack web application analyzing 121,391 mathematics research papers with advanced topic modeling pipeline (BERTopic, UMAP, HDBSCAN) and Claude AI-enhanced topic labeling across 1,938 discovered research themes.
- Engineered optimized SQLite database architecture with indexed queries and LRU caching, achieving 5x performance improvement in interactive response times for real-time filtering and exploration.
- Developed and deployed professional Shiny dashboard on Heroku with custom domain, featuring dynamic filtering, topic exploration, and author analytics—demonstrating full-stack capabilities from data pipeline to production deployment.

Scientific Collaboration Networks: Multi-Metric Analysis of arXiv Communities (GitHub [\[link\]](#))

- Analyzed 121,391 papers across 1,938 topics using network science techniques (degree centralization, modularity, small-world coefficients, coreness ratios) to reveal how research communities self-organize through collaboration patterns.
- Discovered fundamental dichotomy: popular fields exhibit modular structures (high modularity, low centralization) while niche areas show hierarchical organization through high coreness ratios and degree assortativity, quantifying how scientific communities scale differently.
- Engineered production ML pipeline with automated build system (Makefile), configuration-driven architecture (YAML), and modular Python components enabling fault-tolerant processing with incremental rebuilds and checkpoint recovery across 8 analysis stages.

Hamiltonian Simulation: TFIM via Trotterization (GitHub [\[link\]](#))

- Simulated time evolution of Ising models using matrix exponentiation and Trotter decomposition.
- Visualized quantum observable dynamics and linked numerical error to Lie bracket theory.
- Analyzed the superior convergence behavior of second-order Trotter methods, demonstrating the $O(t^3/N^2)$ vs $O(t^2/N)$ error scaling predicted by the Baker-Campbell-Hausdorff formula.

KAK Decomposition and Quantum ML (GitHub [\[link\]](#))

- Implemented Khaneja-Glaser algorithm for two-qubit gate decomposition and benchmarked against variational learning models.
- Demonstrated practical use of Cartan decomposition and automatic differentiation in PennyLane.
- Achieved near-perfect unitary approximation (~98% fidelity) using a parameterized quantum circuit that mirrors the mathematical structure of the Cartan decomposition for $SU(4)$.

EDUCATION

Ph.D., Mathematics — Northeastern University, 2019
Specialization: Algebraic Topology, Computational Geometry

M.S., Mathematics — Northeastern University, 2014

B.A., Mathematics — Boston University, 2012
Cum Laude with Distinction in Mathematics
